

Test Plan 5 — Organuz API Contracts (Supabase / PostgREST)

Project	organuz-api
Specs	tests/organuz-api/contracts/projects-contract.spec.ts
Default filter	@other-smoke
Target	Organuz Supabase backend — /rest/v1/projects , edge functions (public anon key)
Client	src/api (OrganuzApi)
Cases	1
Skips	None — anon key baked into config.json
Skill	organuz-api-tests

Scope

Contract-level checks against the Organuz backend, which is built on Supabase and exposes its tables through PostgREST (a REST API generated from the database). The tests authenticate with the public anon key — the read-only anonymous key that ships in the client. In the default suite, one test asserts that the projects REST resource honors its schema contract. There are no writes and no privileged access: row-level security (RLS) keeps the anon key read-only.

Preconditions

- Public internet access to the Supabase host, plus the anon key from config.json .

Cases

ID	CASE	ASSERTS	ALLURE	TAGS
API-01	GET /rest/v1/projects honors the projects	Response rows conform to the	Epic: Organuz API · Feature: Projects	@organuz-api @contract

ID	CASE	ASSERTS	ALLURE	TAGS
	schema contract	expected projects schema/shape	contract · Story: projects resource schema	@other-smoke

Run

```
npx playwright test --project=organuz-api
```

Notes

- The group is filtered to the @other-smoke tag by default. Additional @organuz-api or @contract specs (such as edge-function preflights or RLS checks) only enter the default suite once they are tagged @other-smoke. Adding one changes the documented count (1) — update CLAUDE.md and the parity skill.
- Keep the anon key public and read-only. Never introduce writes or a service key here.
