

Test Plans — OrGanuz AI Site Automation

Written test plans for every automated test group in this repository. Each plan states the group's **scope**, the **Playwright project / target / environment** it runs against, its **gating** (when it may legitimately skip), and a table of its **cases** with what each one asserts.

The grouping mirrors the per-test-group skills in `.claude/skills/` and the "Test Groups → Skills" map in `Architecture.html`. Keep these plans in sync with the specs and with the counts in `CLAUDE.md` per the `test-suite-parity` skill whenever a test is added or removed.

Groups

#	PLAN	PROJECT(S)	SPECS	CASES	TARGET
1	UI Sanity	chromium	tests/ui/**	12	Marketing site (prod <code>www.organuz.ai</code>)
2	Product Public Sanity	product	tests/product/api/**	8	Dev calculator (no login)
3	Product Matrix & Role Contracts	product	tests/product/matrix/**	23	Offline — checked-in fixtures
4	Product Roles E2E	product-setup → product-authenticated	tests/product/flows/**	13	Dev calculator (per-role login)
5	Organuz API Contracts	organuz-api	tests/organuz-api/**	1	Organuz Supabase / PostgREST
6	QA Agent	agent	tests/agent/**	2	Offline — stubs, no network/browser
7	External API Monitoring	monitoring (opt-in)	tests/monitoring/**	50	Live third-party maps — Govmap + Ofek

Default run (`npx playwright test`): 59 tests — **46 green** (chromium 12, product 31, organuz-api 1, agent 2) + **13 credential-gated** role specs (product-setup 3 + product-authenticated 10) that

skip until per-role secrets exist.

Opt-in monitoring (`npm run test:monitoring` , i.e. `MONITORING_ENABLED=true`): adds the `monitoring` project — 50 live Govmap + Ofek availability checks (govmap 25 + ofek 25). It is **never** in the default suite, so a Govmap/Ofek outage can't break the PR gate; it runs on the scheduled **External API Monitoring** workflow and alerts via an auto-managed issue + Slack. With monitoring enabled the total is **109**.

Sanctioned skips (never failures)

- **Group 2 (public sanity)**: skips only on a genuine dev outage — the dev gateway/password gate is down and no UI token can be extracted. A token that *is* observed but malformed still fails as a real regression.
- **Group 4 (roles e2e)**: each role skips when it has no `<ROLE>_PHONE` / `_OTP_CODE` credential (product-setup) or no saved session (product-authenticated).

Everything else must pass. See `CLAUDE.md` → "Conventions" for the full policy.

PDFs

A PDF of every plan (and this index) lives in `pdf/`. Regenerate them after editing any plan:

```
npm run test-plans:pdf    # renders docs/test-plans/*.md → docs/test-plans/pdf/*.pdf
```

Markdown → HTML via `marked` , HTML → PDF via Playwright's headless Chromium — no external tool required.
